

## Why You Don't Have Full Control Without ERP-Based Inventory

**Industry:** All

**Primary Persona:** CEO, CFO, VP of Operations

**Sales Stage:** Discovery / Pre-Demo

### 1. You Don't Have Financial Control—You Have Delayed Estimates

When inventory is outside the ERP, financials depend on:

- Imports
- Batch updates
- Manual journal entries

That means your numbers are **always behind reality**.

**What this looks like:**

- You close the month and adjust inventory by \$400K
- Margins shift after the fact
- WIP or COGS gets “trued up” instead of known

 **Reality:** You're not managing the business—you're **reconciling it after it happens**

### 2. You Don't Have Margin Control—You Have Margin Assumptions

Standalone systems rarely capture:

- Landed costs (freight, duties, inspections)
- Real-time cost changes
- Job/project-level cost accumulation

**What this looks like:**

- Sales thinks margin is 28%

- Finance later shows it was 18%
- No one catches it until it's too late to correct

👉 **Reality:** Pricing and purchasing decisions are based on **incomplete cost truth**

### 3. You Don't Have Operational Control—You Have Conflicting Systems

Sales, ops, and finance are looking at **different data sets**.

**What this looks like:**

- Sales sees inventory available
- Warehouse says it's committed
- Purchasing already reordered it
- Finance doesn't trust any of it

👉 **Reality:** The business runs on **negotiation between departments**, not execution

### 4. You Don't Have Traceability Control—You Have Exposure

Especially in aviation distribution, traceability must be:

- Complete
- Immediate
- Defensible

Standalone systems often:

- Track serials partially
- Lose linkage between transactions
- Require manual reconstruction

**What this looks like:**

- Audit request comes in
- Team scrambles across systems, emails, spreadsheets
- Takes days (or longer) to piece together

👉 **Reality:** You don't have traceability—you have **forensics under pressure**

## 5. You Don't Have Decision Control—You Have “Financial Noise”

This is the one most executives feel but don't always articulate.

When systems are disconnected:

- Reports don't match
- Teams debate numbers
- Decisions get delayed

**What this looks like:**

- Inventory says one number
- Finance says another
- Leadership asks, “Which is right?”

👉 **Reality:** You're not making decisions—you're **resolving data conflicts**

## What “Full Control” Actually Means

A business is in control when:

- Financials reflect reality **as transactions occur**
- Inventory availability is **accurate and trusted**
- Costs are **complete and actionable**

- Traceability is **instant and defensible**
- Everyone operates from **one version of truth**

That only happens when:

👉 **Inventory, operations, and financials are unified in the ERP**

## The Hard Truth (This Is the Message That Lands)

If inventory is outside your ERP:

- Your financials are **lagging indicators**
- Your margins are **approximations**
- Your operations are **misaligned**
- Your compliance posture is **reactive**
- Your leadership decisions are based on **negotiated data**

## Bottom Line

You may be running the business successfully...

...but you are not **controlling it with precision**.

And in aviation distribution—where:

- Parts are high-value
- Traceability is mandatory
- Margins are tight

—that gap between **running** and **controlling** the business is where profit, risk, and credibility are won or lost.
